

WIRE EDM DRESSING

OF METAL-BONDED GRINDING WHEELS

- Precise profile and detailed accuracy are easily achieved
- No chipping of binding matrix components
- Only the binding material is being machined
- Wheel life extended 6 to 10 times longer
- Up to 280% faster feeds during grinding achievable
- Dramatically reduces processing costs

The wire EDM dress process creates a more porous surface on the wheel, allowing more grinding fluid into the cut.
